Ch. Papes Much 6th 1814 10.8.4. The Typhoid state of Bilian Fever by Silm Hayword North Carolina

de has proba The. The fellowing apay with be empired the the desired the country apay with be empired to the desired, with annually appears overy summer and autumor, in the eastern country of the March Carolina.

It has been selected by the counter, because the discase more prequently than any other of equal days, has come under the observation, has been of timera, subject of anidalation, and because, the task of writing is calculated to sender him; more intimately assumed as with the nature and tentiment of it, and it him but from; threshy, the better greatfying precedits to me due the growing, to which my his breaters, he will sout probably be exposed.

The decease is that turnmention of abstrameteents and Association to Continued fever, which is estimally decommatics, expecially in popular language, the Burrows or Typhon Bover; neither of which terms, however, seemed, pleased: the first, being experies of a symptom that often exist, but is likewise of the absent: the lattice is

togo dence . Step will a to her

my parent red of the Us bug to

3

may be preserved on some one of the established days of civis. It may be known to have taken place by a cessation of all intermepions, or by much diminished remissims. The pulse, that was full, hard, or chorded during an executation, now continues with title variation thoughout the day, quick, feetle, and often inequality or, according to boot Jackson, "that which was turnetting hard, and contracted, sluggish and obscure, throng the early stage of the disease, at this time after becomes slow, soft, full, and regular, so as to be distinguished with difficulty by the experienced from the pulse of a puson in health". The burning heat of the skin is no longer present, but it sometimes becomes most with unnatural purporation, at time, "ameling a disaqueable odown, resembling the smell of a fish market." It is after thisker and more compact, the colour changing to a faint dull yellow, though, entirely different from the founds. ced shin. Doet Jackson, while speaking of the fevers of the West Indies, says, that the eyo becomes calm, cleanand bug th" at the commencement of the "Reliagrade course", the

name given by him to the Elyphoid state. The counter mance losses its natural vivacity of experien, which is sometimes retained until this period, and always under gres a considerable attraction, that will forever be nearnized, by me who has mee beheld it, aget admets of no clear and circumstantial description. The womiting of dark and green Bile, copious and distraping in the first pirods of the disease, no longer emtiries, and the Stomach, comparatively remains quiesent. The patient expresses on inclination for food, and his clamaus for drink, are hus hed. The tong we, heretofore, enerceted with a white and yellow for, vains its as piet to a hue of mixed dark and yellow. The disease advancing, the tong we and mouth are lined with black son due, as in genuine Typhus, and the breath is always highly offensive. The bowels, costive in the original direase, experience no relief from the revolution going on in the Lystem, torpor, Itill Hands as a fartifican tim of disease, unchanged by the recipitudes of its action, and many times, impregnable to the most powerful,

41 41 infall hode 14,0 14 p more ties a in g 14 ZK disease 14 00 dijote

and most shiffely concerted bombardment of the Physician. When, by the force of our remedies, we on tain alvine descharges, they are small in quantity and of a dark colour, much resembling as has been happing by said " Tan or molaps"; but should we succeed in sumoring the unsusceptible state of the Intestines to impulpions; thin these matters are eliminated in producious and astinishing quantities. Museular pauor, only gradually declining, or occasionally receiving increased vegaus from the exacertations of the present ding fever, at this stage, rappedly links to a state of prostration, and debility is conspicuous in every movement of the patient. The intellectual parent ties are preserved much more entire, than they are in genuine Typhus, and it is only in the last house of the disease, that low delessem supervines.

When we reflect on the symptoms, which the swease, in to changed constition, present, in cannot be set a loop to pronounce, what alteration in the system. That change has inscreed. The feneral

day fand, offing other

one time, bold and energetic, hurried on every action of the body; speed was given to the Hood in all its repels, and heat generated proposely but now the preture is uncosed - The ineutation is lan quid, The superfecies odd and shireled and aren thing denotes a tendency in the system, to usolve telf, from an organized, into an inorganic major This condition appears to legencing to a desertion of the Hord from the surface, to its mere inhunal repels, and is produced. by the cause of the disease, first, acting as a morbed stimulant on the Homach, which accordingly produced all the phenomena of Minutalion; but the mortid agout, after a few days, envolves this, and the contiguous us gand, in disease, and then, as a consequence, an afflux of the fluids takes place to the parts, as en common inflammation from other eauses and in other parts, hence, the engarged state of the abdom inal reserva, which has been often observed on defectim. This may be turned an engargement of the

capillaries of the internal organs, but doubtlep a cewent esngestion, also exists, and is produced by an inability of the heart to force the blood to the memute and distant repels, adid to a feeble neps of the arterial and capillary system; this state of muscular debitity is occasioned by the previous exextenent. I an aware that the premises, on which my reasoning is exected, are denied; that by many, the cause of Fever is considered directly sectative, and, that the stomach , but by few authors, is thought to receive the poison of the disease. It is however, repug nant to the present day mas of the schools, to denominate any of our medicines sedative, and we have the high authority of Proppose, less and baldwell, for the apertion, that in all mature, no individual of such a clap can be found That the alimentary canal, receives the first gorm of the disease, first suffers its spotiation, and in its whole course, continues eminently de anyed in every function, for proof, I need only revert to the

a he OHABI ~ Z su th infife hopes 4 th The de

symptoms, and for confirmation, to the simple and forcible manner in which the opinion is taught and inferred by the american Bathologist of Bover, sock Chapman. The symptoms, which warrant such a belief, are; the fact, that the first deviation from health is almost invariably a derang ement of the the mach, preeding, and from the known sympathies of the organ capable of creating, the distintance in the exculation; the obstinate costinues of the bowel, and the nature of the discharges when procured: these, have been partially described while detailing the symptoms, and it only remains for me now; in support of the opinions advanced, to ascertain this nature, and from whence they proceed. It is a popular opinion, that they are a vitialed secretion of the liver, and even some physicians ambrace the same view, but perhaps, a more rational med mude of accounting for them, will be found in the supposition, that they are a marked secretion of the mucous membrane of the Intestines, which

supposition is rendered almost a demonstrable fast, if we can believe an author, whose general earwetrip remains unquestioned, I allude, to bast Jacken who says, that he has found the tax coloured matto in the mouths of ducte - not blood repel, untity. ing into the colon, and he afterwards observed the same thing in the stomach and other parts of the canal: thus we find the secretion of the mucous membrane of these parts, attered by some effected agent, and as it is always changed by the imflammatary process en other parts of the body, the interence is fair, that the same cause produce it here. But the disease is not confined to the stomach and intestines, for it sometimes involves the other chybeforetie viscura. To be convinced, that the biliary ap. paratus is much attered in its nature and functions we have only to recollect, the character of the Bile ejected from the stomach during the early stages, and observe, the terminations of the disease: the patient may be snatched from a yourning grave

tion of sul, and s must chara The de themse

that opens to receive him, frequently however, even after convaluence is apparently established, we behild him the sufference victim of a chronic inflammation of the Liver, locally proclaiming the bucken that organ had to bear in the previous jerhardy.

ballad to a patient in this stage of Force, we have little difficiently to destinguish the discount the discount to the discount to the section all others, although it may been, to generate "yphus, yet, by conselling the causes which perduced it; the season of the year at which it seems, this in warm an iphous in estal weather; and by learnery the helory of the disease, we must prive at the inevitable conclusion of its time character.

The degree of danger is always eminent and proper tempthy more so, as the symptoms enumerated show themselves in more aggravated forms. Where the pulse is very prequent hobbling, intermetting, ar fluttuing; where "Respiration is laborrous evilla a storie

fun Thomas the ton month Hand hole 6 wif , the he kd, is museu and no

sense of stricture or a desire to expand the chest with out the power of effecting it, and without restraint in doing to from a sense of local pain or impediment;" and, where the shin is materially attered from a state of health, especially when greatly think ened; an unfavourable ipue may be antiechaled, and am Prognosis should be so declared, if circum Thenes under a prediction necepary. When the son dus of the tongue, become estinsive and black, when the tingue strelf, is difficultly thrust from the mouth bentling and quivering, when the patient only opens mouth when told to shew his thingsand can not prolonde it, and more especially if it inclines much to mi hole at the lime an allempt is made to peit it out; wif he is unable to maintain his position on the fillar and slides to the lower part of the hed, inasmuch, as all these symptoms denote great museular detitily, the peoplet of newcy is slight and withing but the most active exertions can poswilly preserve our patient; but when to these symptoms

rigidity of any muscle be added then perhaps there is no chance of recovery. The truth of there remarks, I prequently saw verified, in the practice of the alms House, during the last summer, and to the very instructing, clinical tectures of Bost. I. 16. Mitshell, I awe much of what has been saids We may raik as unfavourable symptom. much want of sweethbilds to ordinary imprepions - such is the constantly delated pupil, deafness, demini whed sense of touch, absence of thirst atthough To mouth may be parched and dry, where the bowels remain unmoved by the most active catharties, the pulse uninfluenced by the thougest stimulants, and the surface insensible to the operation of either blisters or rubefacients, The case may be considered of a most critical nature, tending to a speedy and fatal terminatim, if the patient is prone to constant sleeps and when roused, awakes in a state of low delerium, picks at the bed clothes, and extehes

at imaginary objects; and also, as book Jackson correctly remarks. "under confedence, philosophical formselp, or Storcal indifference is almost always a certain sign of death". Thould the bornels give way to our purgatives, and the discharges of tar coloured matter become copious and free, a reevery may be reasonably expected; but if the discharges are small in quantity and reluctantly gielded, then, we are to dread the contrang result: and for then to resemble a num. . . of small, dark seeds, suspended in a thick and black fluid, is, what I conceive to be, one of the most uneving symptoms of early depotiehow. This granulated appearance of the storts, was first pointed out to me in the summer of 1822, by Doct. Mosely of N. Carolina, a respectable praetitioner of ten years experience in the disease who informed me, that in no one instance had he known recovery to ensue after it was observed, and the future cases, which fell within the limited

leni Heast When whed

the so

Wit mon

tame wild a of the impate

denited sphere of my observation during the same teasin fully emformed his statement. When the debitity is not vary great, or is deniminable by our evacuations, where the pulse is somewhat of should the surface easily and fully affected by this time, more especially in they induce strangury, and finally, when many of the unitained symptoms are inautings ever many by proper management, close attention, and a shifful applies along if produceres means, have the happenship of effecting a cent — this is the deterable object, for the attenument of which it more devolves on us to detail the means.

The desease, excaving as may be inferred from its name, a close resemblance to persone by phone, is in many respect to be treated in the same manner; the emitie, blood letting, and cold application, recommended in some stage of that fever would be however entirely impatured in the freeze would be however entirely impatured in the freeze would be however. The dyphotom

symplems and native of the diese. clearly and interfacting front aut, three different in healiess of tene: first, to relieve the chylopoided visions of the noveland matter with which, they are opposped, remain the terfore of the initistines, and envert the mortid secutions of their muceum; seemely, to restore the analysis and healthy and limits performance of the proper furnishes on the arrange to the proper functions in the arrange and lastly, to counterest distribute.

The active fulfilment of these several induextinct, emilitate the only permanent forenexation or which, our hope of home will almost as a the reglect of any me of them, will almost as a emisquence, amount a fatal colority har. The effoli of mature to excludiols has dominion, are very feetle or entirely wanting, and his that can remember at such a moment, the Hahlian precept, to bail you mature excitons, and only

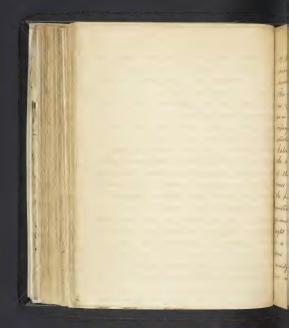

/

aid her as she bruils the way, should remembey only to spurice it, as a dutione, danger out overy bearing, and eitherly invertibly of regard on the present emergency. The indications, are not to be, as in many diseases, schematily and tweespeeds answered, for while stelly configing with the requisitions of one, from inallention to the orders our patient may be look, on the entrary we are to delay merhing, keep me usure, but briefly advance to the attack, and at once power on the enemy the whole will bey of our art.

er article of the Materia Medica, will to emplittly and effectually fulfil the first indicatum, as the free and marly unreserved use of balomel. Invair, I believe, may eve look for an equivalist to this medicine, but happily for humanity the learch is unneceptary; the groundless fear of misshievous effects intertain and by Physicians, for a long time after its interduction

introduction into practice, has been supplanted by a species of confidence and praise nearly devolunal. Calomel may be so exhibited as lo wacuate the bowels and distodge their acrid contents, and what is unquestionally of the almost importance, without exhausting the little remaining strength of the patient, by profuse, waley discharges, like most of the other efficient pengatives. Whinthin my own searty experiences I have seen the sulphates of Magnesia and Toda, Salap, Genna Ge, only produce copions en nations of an agreeous nature, perceptible debililating, the patient, when balomel exhibited he fore and after them, brought off almost un mixed, immese quantities of dark and fitted descharges. It is an admitted fact that its reenficiative powers are unrivaled in the various of pections of the liver, and by a literal use of it in every stage of the disease, doubtless many of the disorders of that viseus, to often sequeine

of fever, would be, and are presented. To produce these effects, I would first give it in such quantities as to open the bowels, and Then emtinue its administration in divided do ses of three or four grains, Three times a day, a in greater or less quantities, as may be necepary to keep up the purgation until the stools are brought to a healthy appearance. balomel given in this way seems to change the morbid state of the mucous membrane of the alimentary tube, and its secretion becomes natural. The requisite portion to open the papages, and keep up the evactuation, is timetimes very great, and I have myself tung as much as, Zifs given in the course of forty eight hours produce the happiest effect. This is a most liberal use of the article, and to tome may appear an abuse, but the unarunity of praetitioners in its adoption, who are most conversant with the disease, is a

strong proof of the propriety of the practice; and although in a healthy condition of The system, five or six grains may produce the same effect as eighty, get, it does not seem inconsistent, a priori, to believe, is hen the bowels are oppressed by an unnatural accumulation and their excitability greatly allived, that this rule should not hold good, and from several old and excellent practitimes I have the fact, that large doses in The desease under consideration are much more beneficial than small ones, indeed, their exfurience proves the usual quantities to be enlively inadequate. The proper quantity, however vaires in every case, and the only correct quick for our government, is to pusist in its administration, until we obtain the end, for which it was exhibited. When the operation is very imperfect, often a simple enema of irain quel known up the rectum, will expedite and render

exprous the discharges

.. Juck are the means, that I would resort to, in the fulfilment of the part indication, but even the propriety of punging as tively at all, in a very similar state of the system, was denied or unthought of, until the invaluable work of soit. Flamillon made known its whiley; since which time, the prac wer has been adopted and fully confirmed by most of the imment authorities on the subject. However, in the precise condition of continued fever, now under consideration, The learnest Ora Jepor of the Practice of Medicine, in the Une acutely of New York, in an apendix to Thom. as' dractice, condemning in strong terms the advice of Flamilton, unheritating by denies the inspirity of active cathactics. He says "eracua. tions from the bowels are not to be obtained at the expense of the powers of the whole syn tem, which the means recommended by sevel.

al the gs sen nel z liens . one, for Lan low Farrence

Flamellon are calculated to produce: on the contrary at this advanced period of Five, in should just as readily think of putting a lancet into the pe tunts arm, as emplying his bowels by the active purges he has directed: these, too, with other mean . I depliction, as far as they may have been inde cated, it is presumed have been already attended to" With the istmost deference to the authority of my distinguished country man, it is with difjedence that an endeavour is made to contro. wit this precept. The presersuption that evacua tims have been previously used, and carried to a sufficient extent, is by no means a fair me, for, et is a fact, which the attestations of all southern practitioners will support, that, when they have been resorted to early, and pushed to the necessary extent in common Bel. ions Fever, The Typhoid state early ar ever he furneres; and in the bestion of country disigna ted at the beginning of this epay, the Physician often

often finds his patient, on the first visit, with all the symptoms, dinominated by sevel. Horacky to be those of Typhoid Fiver; the first Hage of the disease having paped away, without the smallest apertines from medicine. The danger of wasting the excitability of the system, which soit. Horack to much apprehends by the administration of purges, twely, is nothing but a wisionary result of his own theoretical view. the Homach and entertines, the premary seat o- the disease, duranged in every junction, and as it were, engaged with the foul secretion of The mucous liper - are we to be satisfied, with "enemeta or at most, the accasional use of Rhubart and Magnesea"? because, forsorth, the patient has a diminutive pulse and impair ed museular forme! That, the thorough evacu. ation of the intestinal tube, will recover this very emotition, we have the high authority of Hamilton, and the Janetion of the present

bropper of the Theory and Practice of Medicine in this University, who says, "nothing is now bether which the alementary carmal is opposited with accumulations of feedback matter, the examination of this matter, the evaluation of this matter, actions the tystem and adds region to the body," and the hystem is instanced by the unanimens vice and involved practice of these, who live in parts of our energy must expected to the ranges of the disease;

We do not, however, rely bolely on pungatives, but at the same hime sinkfort the system, with the am idies calculated to fulfil the second and third indication, and it will not be different to se left duch, or so combine others, as to accomplish both object at mee. For this purpose, many of the stimulating sea pholiss, would amount perhaps collectingly well, but having seen the tamp borated Julep well, but having seen the tamp borated Julep while with the chelste of Ammonia, in equal pacts, frequently him

tine the to . ne him appe

highly beneficial, I should be induced to to select them, as medicines worthy of my confidence: a table spoonfull of the mixture to be given every two or three hours, or oftener if the skin remain unattered, and the pulse continue the same. Generally this will includely contribute to bring the blood from the centre to the circumference, acting in ement with Blisters, which are now to be applied to each of the extremities, and one over the Epigartie region: these by the irritation which they exerte, cause a nevul sion to the past, of the circulating fluid, and sometimes by the substitution of a new expel the diseased action, according to the general rule, first laid down by John Hunter, that no los diseases can exist at the same time; or in other words, the sysam receives a powerful imprepion, or shock, from the remedy, which severs the concatenation

trun ande 46 such 4 a 1.19 1 dies buses comp

of disease, precisely in the same manner, that the recurrence of a rigor is prevented by a large dose of Opium. Ether, or any ath er stimulant, given a few minutes before the expected time of an attach. The indication of countinacting debility, is also answered by our umidies. Camp hor, certainly, as daily experinec evinces, and the highest medical author elies wer, is a stimulant of no shallow pre tensions: by its administration the pulse is undered more regular and full, stringer and dep prequent: that resicatories popel the same property, without appealing to the masters of our art for confirmation, may be proved by the fact, that in country places, distant from a regular Physician, the heads of fam. ilies by the application of a Btister often preserve the life of an inmate, a cheld, or companion, when the system is in a sinking condition, and the last effort of vitality, the

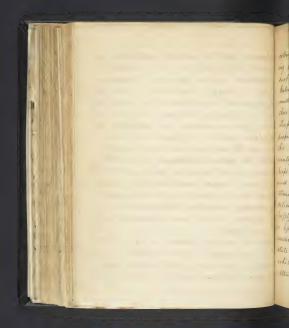

whi ful ma hma neit tim and the , Home custo 34 luke and when

only lingering spark of existence. By experionce this remedy is rendered familiar to thems We aught not however to be satisfied with muely ordering an remidies, but must studiously altend to the effects which they produce. If the pulse continue feeble and intermelling, give the mixture of much shorter intervals than has been intimated, every thirty minutes if necessary to excite the circulation; or call to its aid other stimulants, such as Ether, Wine, Brandy &c; and what is of signal advantage, alternate the Camphorated with the Volatile Julep; the Homach after a day or two, may become accustomed to the presence of the former, and no longer susceptible of curative imprepions from it, then by alternating another estate lished stimulant, this condition is removed, and the benefit originally derived, again experienced. The patient may be to far

hood Rube Pepp them roda Linas belie again 1/40 harl lion When hold 4977

exhausted, that the vesicatory applications will produce little or no effect, then we resort to Rubefacients, such as docvetions of Congenne Pepper in Brandy, Canthacides in Oil of Turpentine &c.; the burface to be rubed with them by pieces of Felannel until an universal glow is induced. The application of Ginapisms over the stomach and to the Boles of the feet, will also be of service. after this plan of treatment restires the patient to that degree of exertement, at which an former remidies will have their usual effects; then we should recur to them, and particularly, maintain the determination to the surface, by the more permanent inita line of Blisters When this course of treatment has been persisted

in for a few days, eve often are gratified by the helding a subsidence of the more dangerous symploms; the facus changing to their natural

colour, foulness of the mouth and tongue giving place to an ordinary condition, and the hurface mederately warm and moist. The balomel aught now to be omitted, and we must substitute for our stimulant Biaphoreties, those of a louis description: an Infesion of Serpentaria and botomto may be very appropriately introduced. The liberal use of this anedicine, at the present stage, will eminently conduce to a speedy convalereener. It keeps up a moderate moisture of the stien, and gives tone to the delicate and infulled Stomach, quarding against a relapse, and soliciting a return of appetite. It is to be preferred to the Burian Back, because it is lip afit to occasion constitution, than that medicine; but when the palient arrives at a state of convalibeence, then the Back may be exhibited to establish and confirm the one Altention + hould be paid to the Borrels during

menery, and if enshipation ensues, let it be obviouted by some mild appreciate, as Magness or Rhubart: the latter, is perhaps preparable to all athers from the tonic power, which it populars, betwee bestienties are to be avoided at the time, as tonding to implace the receipt ration powers of nature, which are now properly directed. If Biarchora comes my check it, by Opicum and the use of the cin above. The patient while recovering, is sometimes harafed by restlepsif and the want of steep. When this happen, a grain or two of Opicum should always, be given at bed time

With regard to Biet, it may be said, due sing the alarming stage of the diese. that the hatient will be decisous of nothing, and arthing is esquirte; but when the applicate begins to return, it is of the highest importance, to guard against it dietates, for nothing

Reg this Nothing is better adapted to produce a relapse, than improper food. The storach feelle to an extreme, is incapable of dizerting any, but the most meld and medicine are tiels. We should at first restrict our partient to arrow Ravot, Barley, dazo, Rice, mild ke, and gradually restore him to his usual diet, by the intervention of the milder hims of anienal hibitimess, such a, Eggs, Rysturs, bhicken and the like.

Recovery may be accelerated by moderate exercise in a carriage, but we must be cautions of creating fatigue. The patient aught to be prevented from engaging to early in his usual avocations, and an exposure to cold or heat and might air thould be avoided
